Screen turns on and off repeatedly

Some Users reported monitor or screen going to sleep or turning off by itself while watching a movie, playing video games or doing nothing. This usually happens after a couple of minutes. Most computer screens nowadays are able to save energy by dimming down the back light of the screen itself to a lower percentage, or by just completely turning off the screen. While this may save power, it may be annoying whilst watching a movie. Because of different situations, Windows implemented features to control the internal energy saver, to allow you to set, disable or modify this behavior. Unfortunately some Users are still not able to modify their system, regarding saving energy or turning off the computer screen. Despite setting Windows to never turn off the computer screen or only dim after an hour or more, users still experience a black screen after the initial 10 minutes or so. In this guide I will tell you what may be the cause and how to resolve this issue. A freshly installed Windows 10 will automatically turn off your computer screens after 10 minutes. To disable that, right-click on the Windows-icon in the bottom left corner of your taskbar click on Power Options. Now click on Change plan settings for the selected plan. In the now opened window you are able to change the values for Turn off the display. Change it to Never or set a time. Test to see if this resolves the issue, if not move to Solution 2. Solution 2: Malware Scan Certain malwares on boot can also trigger this behavior. Users reported, that after scanning their systems with Malwarebytes, they were able to have this issue resolved. See further steps here Solution 3: Repair System Files If system files are corrupt, they can prompt Windows to "skip" the settings user has specified. Windows has a built-in utility called SFC Scan to repair system files. See steps here Closed. This question is off-topic. It is not currently accepting answers. Want to improve this question? Update the question so it's on-topic for Super User. Closed 6 years ago. The PC is just fine, been runing okay for a few years. The monitor however, has issues. It is an odd issue that might be a sign of future broken monitor. For no apparent reason the monitor will just power off, so I have to manually turn it back on and it is fine. Is there something I can do to fix this besides the warranty? I already had it repair and I don't feel like shiping it again. I kind of want to just open it up, learn how to solder and well, you know the saying: If you want something done right then do it yourself. Updated: 11/13/2018 by Computer Hope Several issues can cause a monitor to turn off randomly. Some of the reasons relate to the monitor while others relate to the computer. Read through the following suggestions for reasons why your monitor may be turn off by itself. Note If your computer turns off when not being used, but wakes up when pressing a button, there's nothing wrong with your monitor. It's operating according to your power management features. Monitor overheating One reason the monitor could shut off is because it's overheating. When a monitor overheats, it shuts off to prevent damage to the circuitry inside. Causes of overheating include dust build-up, excessive heat or humidity, or blockage of the vents that allow the heat to escape. If the monitor is overheating, unplug the monitor and let it cool down fully before using it again. Then, if you have canned air (anti-static, for electronics), try to blow out any dust inside the monitor casing. If the computer room is very hot, cool it down by turning on a fan or the air conditioning system. Wait until the room cools down some before trying to use the monitor again. Also, if you're using an older CRT monitor, upgrading to a newer flat-panel display resolves many heat-related issues in a hot environment. Loose cable If the power cord is not securely connected to the back of the monitor, it can cause a loss of power and turn off the monitor. Make sure the power cord is firmly in place in the back of the monitor. It's also possible that the power connector in the monitor is going bad and not receiving adequate power from the power cord. In this case, it is best to replace the monitor instead of having it repaired. Bad monitor Another reason the monitor could shut off is because of a malfunction in the circuitry. There could be a short in the wiring or a circuitry failure causing the picture to go black or the monitor to shut off. In this case, there may not be much you can do other than buying a new replacement monitor. Monitors are usually not economical to have repaired since the repair cost can be more than the price of a new monitor. You could bring the monitor to a computer repair shop to have it looked at, but they're likely going to suggest having it replaced. Video card or motherboard problem If the monitor stays on, but you lose the video signal, it's very likely an issue with the video card or motherboard in the computer. A computer randomly shutting off can also be an issue with the computer or video card overheating or a defect with the video card. My video card isn't working. If the video card is a known good video card or its part of the motherboard, there may be problems with the motherboard. A bulged capacitor or other failing components on the motherboard can cause a computer or monitor to shut off. How to test a computer motherboard and CPU for failures.
