## Fruit tree spraying guide nz

All pesticides listed in this publication are contingent upon continued registration. Credit: W. Leaf-Feeding Caterpillars— Gypsy moth (*Lymantria dispar*), tent caterpillars (*Malacosoma* spp.), fall webworms (*Hyphantria cunea*) and others may be controlled by applying a spray with *Bacillus thuringiensis*. The weather is the greatest variable related to pest control. Contact the Division of Pesticide Control at (603) 271-3550 to check registration status. \*\*Additional note, added by A. Powdery Mildew— Various formulations of wettable sulfur or potassium bicarbonate can aid in management of powdery mildew problems. This spray schedule is developed for the average conditions existing in New Hampshire. Captan is generally considered a good choice for management of many fruit diseases. Mummyberry of blueberry. Insect Pests Aphids— Insecticidal soap or malathion may help in aphid outbreaks, but most fruit-attacking aphids are held in check by predators. Peach tree borer evidence: gum mixed with "sawdust". Soil Pests— Several soil insect pests such as white grubs may be troublesome in strawberry beds. Adult spotted wing drosophila adult. Additional Video Resources Do you love learning about stuff like this? SUBSCRIBE TO GRANITE STATE GARDENING A monthly newsletter for New Hampshire gardeners, homesteaders and plant-lovers of all kinds, that includes seasonal suggested gardening tips, upcoming events and articles with proven solutions for your garden and landscape. Black Knot of Plum and Cherry— This disease causes black knots/ growths on twigs and spurs. Black Rot of Grapes— The fungus causing this disease overwinters on all parts of the plant, but mummified berries on the ground or clinging to the vines are the major infection source in the spring. None are now available for backyard use, so the best defense is to avoid mechanical injury to the trunks. Captan, propiconazole, chlorothalonil, or myclobutanil (Immunox - Do not use Immunox Plus, it is not labeled for use on fruit) are registered. The following sections will give examples and situations where supplementary sprays or sanitation may be helpful. Insecticidal soap may help with psyllas. To avoid such problems, eliminate grass from your beds and don't locate the beds in areas where grass grew the previous year. But new labels require that a second application cannot be applied until 14 days later. Select resistant varieties of plum. Smith. Supplemental Spray Materials The proper use of supplemental spray materials can increase the yield of usable fruit. Cherry Leaf Spot— The fungus causing this disease overwinters in infected leaves from the previous season. Spotted Wing Drosophila (*Drosophila suzukii*)— Spotted wing drosophila attacks ripe raspberries and blackberries, blueberries, plums, currants, some grapes (especially dark varieties with thin skins), some peaches and August-October maturing strawberries. The most severe problems are in Rockingham & Hillsborough counties. Examples of resistant varieties are: Freedom, Jonafree, Liberty, MacFree, Nova Easygro, Prima, Pristine, and Redfree. Plum Curculio (*Conotrachelus nenuphar*)— This insect attacks very young apples, causing most of them to drop in June. Adding a spray of carbaryl when the fruit reach ¼ inch diameter will control this insect for seven days. Cedar apple rust: fruiting body on cedar. Credits: J.O'Brien, USDA FS leaf spot on apple leaf and juniper gall (bottom). Peach Leaf Curl— Leaves become curled, crinkled, thickened, and red, pink or purple. Japanese Beetle (*Popillia japonica*)— This insect is sometimes a problem; add carbaryl (Sevin) to the spray mixture or use carbaryl alone. Green apple aphids with one of their predators, the orange maggot. If surface blemishes on fruit do not bother you, you may follow a less intensive schedule. Apple scab. Download the Resource for the complete fact sheet and a printable version. Some mixes are labeled for tree fruit only. Pesticides must be applied only as directed on the label to be in compliance with the law. Peach Tree Borer (*Synanthedon exitiosa*)— These insects attack the trunk and main limbs of trees and are best controlled by spraying the lower trunk and the crotches thoroughly during July and August with an insecticide that lists peach tree borers on the label. Adult Japanese beetle. The label will clearly indicate what pests are affected. There are traps to guide if/when spraying is needed. General Purpose Spray Mixtures General purpose spray mixtures are useful for the control of common pathogens and insects that attack fruit, except plum curculio, peach tree borers, and pathogens that cause black knot of plum, cedar apple rust, fire blight, and peach leaf curl. Call toll free at 1-877-398-4769, Monday to Friday, 9 a.m. to 2 p.m., or e-mail us at answers@unh.edu. Most all-purpose spray mixtures have too-low a concentration of permethrin to control curculios. Captan, copper soap, and myclobutanil are effective for control. To really control plum curculio, adding a supplemental spray (like carbaryl) is necessary. Diseases Apple Scab— When growing scab resistant varieties, fungicides are rarely needed. Usually not a serious problem in New Hampshire, except on grapes. Credits: W. When this program is followed, trees and small fruit plants should be reasonably free from insect and disease injury. Remove and destroy all unharvested fruits and mummified fruits from trees after harvest. Leaf spot symptom. Warm, wet weather in the spring favors the development of apple scab, cedar apple rust, fire blight, mildew, rots, and many other diseases. Some varieties of grapes are sensitive to sulfur. Black rot of grapes; fruit rot. Pear psylla nymph covered with honeydew. per gallon of water or 2 1/2 cups per 5 gallons of water, when buds begin to swell in the spring. Trunk injury greatly increases attractiveness to peach tree borers, to lay eggs. Some backyard products contain permethrin. Scale Insects— These are sometimes troublesome on backyard fruit plants. Cut at least 6-12 inches below any sign or symptom of the disease. Dispose of empty containers safely, according to New Hampshire regulations. It is unclear whether or not products containing the pyrethroid, zeta-cypermethrin, will offer equivalent control as carbaryl. Fire Blight on Apple and Pear— This disease primarily affects spurs and twigs. Propiconazole is effective for brown rot, and chlorothalonil is also labeled for brown rot. Spray Schedule for Tree and Small Tree Fruits Tables 1-4 summarize spray schedules for fruit trees and small tree fruits. Gray mold. Captan, *Bacillus subtilis*, and *Streptomyces lydicus* are registered. A 3-spray program (just before bloom, full bloom, petal fall) may eliminate the need for fungicides during harvest. Blackened leaves and twigs are signs of psyllas. Check the label before you buy. It is controlled by cutting out and burning the diseased twigs in the fall, winter, or very early spring. The ingredients usually include one or more insecticides (such as carbaryl, permethrin, malathion) and one or more fungicides, usually captan, sometimes sulfur. Scales: Eggs exposed from under adult scale cover. Use appropriate materials for the pests indicated (consult pesticide labels). Refer to the labels for precautions before mixing any pesticides. The choice is yours - total reliance on general-purpose mixtures is simple and convenient but can be wasteful at times, may harm non-target species and may increase the risk of pests and pathogens developing resistance to pesticides. All infected wild trees adjacent to the orchard should be destroyed, if possible, to prevent spread of the disease. Warm, wet weather in spring favors the development of apple scab, cedar apple rust, fire blight, mildew, rots, and many other diseases. Credit: APS Press, Photograph courtesy R.C. Pearson. Late-maturing varieties are the most heavily hit. Pear Psylla (*Cacopsylla pyricola*)— Psyllas suck plant juices, and can stunt pears. Cranshaw, CSU, Bugwood.org. These trees should be removed, where practical, or remove galls in late winter to reduce infection on apple leaves and fruit. Rust can be controlled by applying copper soap (copper octanoate) prior to pink bud, or myclobutanil from half-inch green through pink. Garden supply stores sell general purpose mixtures under a variety of names. It is controlled by cutting out and burning blighted branches as soon as they are seen. Brown rot on nectarine. The material must be eaten by caterpillars in order to work. The disease is controlled by applying copper soap after leaf drop in autumn (best) or before buds swell in spring. Mummyberry of Blueberry— Fruit turn grayish, dry and drop off before ripening. Effective insecticides include Entrust, Malathion (high rate), Extrel and others. If there is a history of fire blight, copper soap can be applied as a late dormant spray (do not apply copper after green tip or fruit injury may occur). Coös, Grafton and Carroll counties have the lowest problems. Spray oil can help control certain aphids, mites, scales, and pear psyllas on fruit trees (oils can also suppress some diseases). Removal of mummified fruit is important for management. *Bacillus subtilis* (Serenade) is registered for fire blight and gray mold, *Streptomyces lydicus* (Actinovate) is labeled for small fruits for gray mold and powdery mildew, and potassium bicarbonate is effective for powdery mildew. Reliance on a mixture simplifies spraying fruit. Since all pests do not always threaten your crop in combination, use of the mixture results in some unnecessary spraying. Clean up fallen fruit before, during, and after harvest. If susceptible varieties are grown, rake and destroy fallen apple leaves in autumn. Copper soap (copper octanoate) is effective for cedar apple rust, fire blight and peach leaf curl. Adult apple maggot. Cultural practices that promote air circulation can reduce infections. The Ask UNH Extension Infoline offers practical help finding answers for your home, yard, and garden questions. *Bacillus thuringiensis* (Biohit, Dipel, Javelin, Sok-BT, B.t.) is effective on foliage-feeding caterpillars. Gray Mold of Strawberry and Raspberry— This disease is also called Botrytis fruit rot. It is effective for many pests, including apple and blueberry maggots, Japanese beetles, spittlebugs and tent caterpillars. Under such conditions, it may be necessary to spray more often to prevent infection. Credit: D. Codling Moth (*Cydia pomonella*)— The larvae tunnel in apple flesh, and feed on the seeds. After each cut, disinfect the pruning tools with a mixture of 1-part chlorine bleach and 9 parts water or 70% isopropyl alcohol. Combining insecticides and fungicides in your sprayer tank as needed is more complex, but uses only what is required, when it is required. They are usually controlled by sprays for curculio and apple maggot. Apple Maggot (*Rhagoletis pomonella*)— The larvae tunnel in apples in July & Aug. If they are a problem, apply a "superior" oil spray, 5-6 tbs. Sevin is registered for all of the listed crops. Surround is a non-toxic alternative, but is very tricky to apply correctly. Read the label before buying! Some strains of B.t. (Example: israelensis) do not work on caterpillars. Credits: J.O'Brien, USDA FSBrown Rot of Cherry, Peach and Plum— The fungus that causes this disease overwinters on mummified fruits hanging on the tree or on the ground. Fire blight. Download ResourceIntroduction Disease and insect control measures suggested in this guide are recommended only for home fruit production. Attacked fruit turn sour and quickly rot. Peach leaf curl. Dry, hot weather is often more favorable for insect population buildup, so it may be more difficult to control insects during hot, dry weather. One such minimal spray schedule for apples is indicated in the chart. Be sure to thoroughly wet the entire surface of all limbs and twigs, especially the top of plants and trees. Early maturing varieties of brambles and blueberries may escape significant attack. Watch for supplementary materials (time of application) and pests to be controlled. Credit: APS Press, Photograph courtesy C. Myclobutanil and Captan are effective for control. Wallingford May 2019: Carbaryl may now be more difficult for home owners to acquire. Adult codling moth. The ingredient pesticides can also be purchased separately and mixed when used. Scales: Nymphs next to a shell. Trade names include Dipel, Xentari, Javelin, Biohit, and others. High rates of nitrogen fertilizer often create psylla problems. Cappaert, Bugwood.org. \*\*Additional note, added by A. Cedar Apple Rust— The fungus causing this disease overwinters on red cedar trees or junipers growing nearby. Removing affected fruit before they fall, adding 2" of mulch and spring cultivation will help reduce infections. Got questions? Relevant Articles and Videos Growing Great Fruits video interview series Protecting Fruit Trees From Insects and Diseases webinar Selecting the Appropriate Pesticide and Reading the Label article for gardeners Managing Pests with Integrated Pest Management article for gardeners Considering Organic and Natural Products article for gardeners For more related fact sheets, go to extension.unh.edu/resources/category/Agriculture and extension.unh.edu/tags/growing-fruits-home Stop! Read the label on every pesticide container each time before using the material. Botrytis also causes blossom blight on blueberries. It can be somewhat effective on plum curculio (a major, serious tree fruit pest), but not in the low concentrations available to backyard growers. Raking fallen leaves in the autumn is essential for control. Sulfur is particularly good for powdery mildew, and is somewhat effective for scab, rust, and brown rot. A. Myclobutanil is effective against brown rot and cedar apple rust. However, these products will certainly have activity on common apple insect pests and offer an alternative to carbaryl. Black knot.

Corvea Agriscience™ is a publicly traded, global pure-play agriculture company that provides farmers around the world with the most complete portfolio in the industry 04/01/2022 - WednesdaySun The, January 05, 2022, Blenheim Marlborough.
